

Oxygen plays an important role in producing pulp and paper products. Wet end processes such as washing, bleaching and pulping require a reliable supply of oxygen; effluent treatment like oxidation, wastewater treatment, and ozone sterilization allow these facilities to meet government mandates. AMCS supplies oxygen plants and services for owner/operators or industrial gas companies supplying this industry. ACMS industrial gas plants provide paper producers with the on-site capacity to meet demand for the industrial gases they need.

#### **Applications:**

- Bleaching
- Pulping
- Washing
- Wet end

#### **Gas and Liquid:**

- Oxygen

#### **Application Examples:**

- Oxygen, specific to combustion and chemical oxidation by replacing air in the Pulp and Paper arena, is used to:
  - Reduce emissions by oxidation and waster water treatment
  - Bleaching of products through ozone oxidation
